

HEAVENLY LIGHT VS ORIGINAL

3818

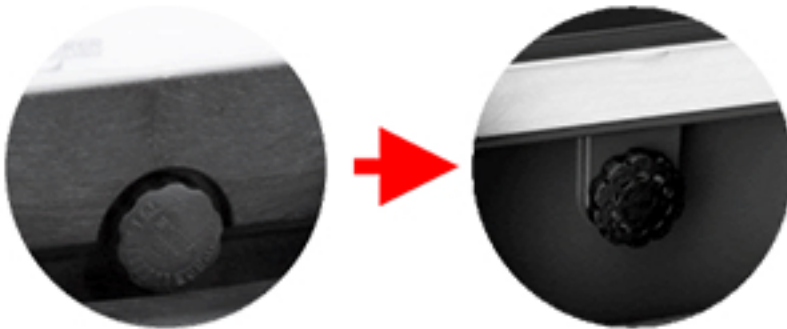

LEGACY

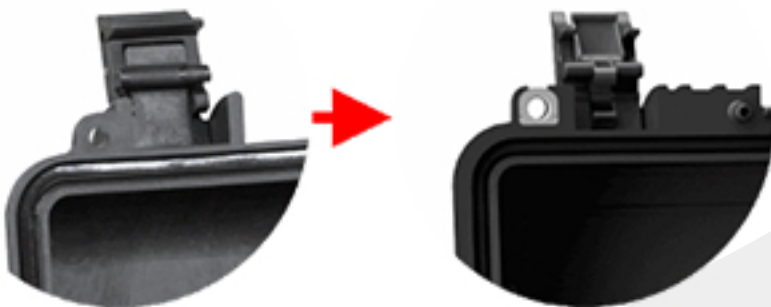

HEAVENLY LIGHT

Whilst the internal dimensions of new HL models remain unchanged, in order to ease the transition of all existing integration projects into the new version, the external of the cases has been redefined to a more functional and aesthetical design, and upgraded in some important details. Hereinafter you can see a comparison between the legacy, previous model and the HL version of one of the most successful Explorer models on the market:

More in details, all these new HL models are now equipped with **automatic purge valve**. Upon demand, it will still be possible to have them equipped with manual purge valve.

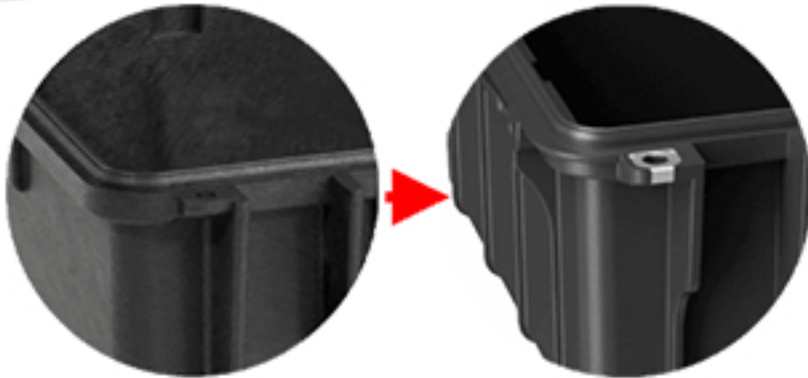

All HL models from 3815 & up mount the **pull-trigger latches**, for a harder, more secure locking, particularly useful in case of accidental dropping of the case. The pull-latch is already successfully equipping all long rifle cases models. Moreover, you will notice that its red pull trigger will be progressively converted into a more discreet grey color one.

All HL models from 3815 & up are provided with the new **rubber coated handle**, redesigned to be lighter without affecting the strength and gripping capabilities.

HEAVENLY LIGHT VS ORIGINAL

Two frontal padlockable holes are now protected by **Stainless Steel clips** to grant better protection and durability of the plastic underneath. Two external "**indents**" are now integrated on the sides of all new HL models to allow the mounting of the fixing points for the optional shoulder strap: the brass inserts fitting the holes come with the shoulder strap kit.

Additional **panel mounting slots** have been added to the internal perimeter of the lid, to grant more hooking points for fixing equipment mechanically. As well, **bumps** have been added to the internal flat surface of the lid, suitable for the proper installation of panels without affecting the integrity of the case.

The **3815HL, 3818HL, 3823HL, 4820HL** join the range of the EXPLORER cases provided with **removable lid**, thanks to the special patented hinge which grants the possibility to remove the case lid when positioned at 45° , thus adding more flexibility of use, particularly for system integration.

The **outer lid design** has been slightly restyled in order to allow a better interstack-ability and new possibility for additional labelling and logo customization at the center of the lid.
